Sequence 6, Application US/08810572A

Sequence 6, Application US/08810572A

Patent No. 5969102

GENERAL INFORMATION:
APPLICANT: WICHARD

TITLE OF INVENTION: CAML, NUCLEIC ACIDS ENCODING THE SAME AND METHODS OF USE
TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

TITLE OF INVENTION: THEREOF

TOWNERS OF SEQUENCES: 11

CORRESPONDENCE ADDRESS:
ADDRESSEE: David A. Jackson, Esq.
ADDRESSEE: David A. Jackson, Esq.
STREET: 411 Hackensack Ave, Continental Plaza, 4th
STREET: Floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
SUFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/810,572A
FILING DATE: 28-FEB-1997
CLASSIFICATION: 536
ATTORNEY/AGENT INFORMATION:
NAMME: Jackson Esq., David A.
REGISTRATION NUMBER: 26,742
REFERENCE/DOCKET NUMBER: 1340-1-007
TELEPHONICATION INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible

GENERAL INFORMATION:
PAPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: MUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERBRICATION NUMBER: US/09/328,352
CURRENT PILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100 ANIDLEKSRTG-----DEIILPRG---LEYTVEECTCEDCIKSKPKV----DSDHCFPL 146

ಠ disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythemacosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA protein cysteine-rich consensus region The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand); having the consensus region of TACI, BCMA, or the TACI bCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, agastrointsethnal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic disease (asthma, hypersensitivity lung disconding the state of the state

Claim 1; Fig 10A; 94pp; English.

Sequence 34 AA;

```
The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2, by at least one modification in the region connecting &bgr; strands NO:2, bad E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antitheumatic, antinflammatory, antiartitic, dermatological, antidabetic, neuroprotective, antithyroid, antipyretic, nephrotropic, and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 biological activity in a mammal. TC is useful for inhibiting TALL-1 dependent diabetes mellitus, multiple sclerosis, mysthaenia gravis, dependent diabetes mellitus, multiple sclerosis, mysthaenia gravis, crave's disease, autoimmune hemolytic anaemia, autoimmune thrombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococal glomerulonephritis and cute rheumatic fever, post-streptococal glomerulonephritis and polyarteritis nodosa. The present sequence represents a cysteine rich
 ö
 Novel TALL-1 antagonist protein useful for inhibiting TALL- 1 biological activity in mammal, has a modification in the region connecting beta strands D and E that reduces the biological activity of TALL-1

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding patrner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell

 The present sequence represents a BCMA (not defined) polypeptide. BCMA is a necrosis factor (NF)-kB activator. The method of the invention is used to identify compounds which modulate BCMA activity (and thus NF-kB activity). The specification describes a method of identifying a polypeptide which increases gene expression from a promoter. The method involves contacting a library of with a cell which expresses a
BCWA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence

treatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R.

"Specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders. The BAFF-R proteins may also be used in the treatment of immunosuppressive disorders and HIV infection, and in patients undergoing organ transplantation. The BAFF-R proteins or BAFF-R specific antibodies may be used for treating, suppressing or altering an immune response involving a signalling pathway between BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, grave's disease, multiple myeloma, B-cell carcinomas, lumphomas, lumphoma

The present invention describes a nummin tension includes account tecepool designated Ziffil2 (I). (I) has cytostatic, immunosuppressive, dermatological, antiafilammatory, neuroprotective, antidiabetic, antiathmatic, mephrotropic and hypotensive activities, and can be used in gene therapy. (I) can be used for inhibiting, in a mammal, the activity of a ligand that binds Zinfil2 (e.g. ZINFA), for treating disorders and diseases associated with B complexity in a mammal, the activity of a ligand that binds Zinfil2 (e.g. ZINFA), for treating disorders and diseases associated with B complexity in a mammal, the proliferation of tuneur calls. (I) is useful for treating autoimmune disorders such as systemic lupus erythematosus, myasthenia continumed arbititis, bronchitis, emphysema and end stage renal failure cor renal disease such as glomerulomophritis, vasculitis, chronic lymphoid cor renal disease such as glomerulomophritis, and for treating renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, or amyloidosis, hypertension, large vessel diseases, graft rejection and Crohn's disease. (I) is useful for codulating the immune system. for regulating B cell responses and development, for modulating development of other cells, antibody communication. The presents expresents a protein which is given in the presents appresents a protein which is given in the presents.
 ö
 isolated human tumor necrosis factor receptor polypeptide, termed 12, useful for treating autoimmune disorders, emphysema, end stage failure or renal disease and lymphoma.

The present sequence is the protein sequence of a human polypeptide encoded by a gene that exhibits decreased expression in colon cancerderived metastases compared to normal colon tissue. It is an example of claimed polypeptides that are encoded by genes which are differentially expressed in metastatic colorectal cancer cells. Such polypeptides are useful in diagnostic and prognostic assays, for raising antibodies useful e.g. in immunotherapy, and in screening for modulator compounds of therapeutic value
 cancer, useful for
 New genes that are up- or down-regulated in colorectal cancer, useful for diagnosing colorectal cancer in a subject, or for identifying modulators of colorectal cancer-associated proteins and genes for treating

The invention relates to the manufacture of a composition for inhibiting the proliferation of tumour cells. The method involves using an antibody component that binds both the B-cell maturation antigen (BCMA) and the transmembrane activator and calcium-modulator and cyclophilin ligand-interactor (TACI). BCMA and TACI binding antibody compositions are useful for inhibiting proliferation of tumour cells, particularly inhibiting proliferation of tumour cells, particularly inhibiting production or a disorder consisting of neoplasm, chronic lymphocytic leukaemia, multiple myelloma, non-Hodgkin's lymphoproliferative disease or light chain gammopathy or inflammation lymphoptoliferative disease or light chain gammopathy or inflammation e.g. asthma. The invention is also useful in gene therapy. The present is

 diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermaritis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, infilammatory bowel disease (Crohn's disease, colltis), acleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atheroscies, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA protein-immunoglobulin Fc region fusion protein
 The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for ARRIL (970, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function

Inhibiting ztnf4 activity in a mammal, to treat autoimmune diseases,

The present sequence represents murine ztnf4, a tumour necrosis factor ligand. The extracellular domains of BR43x2 (an isoform of the transmembrane activator and CAML-interactor (TACI) receptor). TACI or transmembrane activated ocutain a cysteine rich domain, and are used for inhibiting ztnf4 activity. They may also be used for inhibiting RR43x2, TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. Present is associated with asthma, bronchitis, emphysema, end stage renal failure, glomerulonephritis, vasculitis, onephritis, pyelonephritis, renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, amyloidosis, moderating immune response, immunosuppression, graft rejection, graft versus host disease, inflammation, insulin dependent diabetes mellitus, Crohn's disease, inflammation, insulin dependent diabetes mellitus, crohn's disease, point polypeptides, fusions, antibodies, agonists or actousion, and cholesterol renal disease, graft versus host disease, and inflammation, comprises administering a BR43x2, TACI or BCMA extracellular domain polypeptide. The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2, by at least one modification in the region connecting &byr; strands CO and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antirheumatic, neuroprotective, antithyroid, antipyretic, nephrotropic, and vasotropic activity. TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 biological activity in a mammal. TC is useful for inhibiting TALL-1 biological activity in a mammal. TC is useful for inhibiting TALL-1 diseases, rheumatoid arthritis, systemic lupus erythematosus, insulin dependent diabetes mellitus, multiple sclerosis, mysethaenia gravis, carve's disease, autoimmune hemolytic anaemia, autoimmune companie, purpura, Godpasture's syndrome, pemphigus vulgaris, acute rheumatic fever, post-streptococcal glomerulonephritis and acute trick present sequence represents a cysteine rich

the invention features to a composition (1) compitating Avr-3 receptor (tumour necrosis factor ligand family member) related protein (II) a useful for modulating AGP-3-related activity in mesenteric lymph nodes (MIM) of a mammal. (II) is useful in assays to identify cells and tissues that express AGP-3R or proteins contacted to AGP-3R-related protein and for identifying compounds (agonists or antagonists) that interact with AGP-3R proteins. (II) is also useful for identifying intracellular proteins that interact with the respective cytoplasmic domains by yeast two-hybrid screening process. (II) is also useful conde, spleen, and Peyer's patches. AGP-3R agonists and antagonists involved in B cell growth, survival and activation particularly in lymph node, spleen, and Peyer's patches. AGP-3R agonists and antagonists of dentified using (II) are used for modulating B cell response and are used to treat diseases characterised by inflammatory processes or deregulated immune response such as rheumatoid arthritis, graft-versus-chost disease, Crohn's disease, lupus, etc. (II) is also useful in the production of hybridoma cells with (II). (II) is useful in the treatment of inflammatory conditions of joints, e.g., rheumatoid arthritis, osteoarthritis, etc. (II), its agonists or antagonists are useful for treating acute pancreatitis, amyotrophic lateral sclerosis (ALS), Alzheimer's disease, asthma, atherosclerosis, cachexia/anorexia, ischaemic injury including cerebral ischaemia, multiple myeloma, multiple celebrosis, etc. The nucleic acids are also useful for producing the companient of the study of in vivo biological activity The propressing (II), which are useful for developing treaser and for the study of in vivo biological activity. The
 Composition, useful for identifying modulator of receptor for treating asthma and glomerulonephritis, comprises AGP-3 (tumor necrosis factor ligand family member) receptor and encoding nucleic acids.

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRIL (GTO), a tumour necrosis factor-TNF family ligand), having the consenus region of TACI, BCMA, or the TACI EMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointesitnal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human TACI cysteine-rich extracellular region

 셤
 This is the amino acid sequence of the N-terminal, i.e. the extracellular, domain of novel human transmembrane activator and CAML-Interactor (TACI) protein (see AAWY5783). TACI is a lymphocyte receptor protein that is involved in the calcium activation pathway. It is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. The extracellular domain of TACI functions as a binding site for a ligand that stimulates the activation of the cell by inducing the binding of the C-terminal portion (see AAW75784) of TACI to the N-terminal domain of CAML. A recombinant form of the extracellular portion of TACI acts as a dominant-negative or blocking agent and acts to suppress the immune system. It can be used to treat or prevent autoimmune disease, graft rejection or graft versus host disease. The extracellular region is also used in a claimed method for identifying a ligand for TACI, in which activation of the AP-1, CAMP or NF-KB pathway, of NF-AT transcription activation of NF-AT dependent transcription

The present sequence represents an alternatively spliced human TACI polypeptide. The specification also describes BR3 polypeptides. TACI and BR3 are receptors. Tumour necrosis factor (TNF) family ligands TALL-1 and April bind to the TACI receptor, while TNF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for preparing a composition for treating systemic lupus erythematosus
 The invention relates to a composition (I) comprising AGP-3 receptor (tumour necrosis factor ligand family member) related protein (II) attached to a vehicle protein. (I) is useful for modulating AGP-3-related activity in mesenteric lymph nodes (MLN) of a mammal. (II) is useful in assays to identify cells and tissues that express AGP-3R or proteins related to AGP-3R-related protein and for identifying compounds (agonists or antagonists) that interact with AGP-3R proteins. (II) is also useful

BY (SJUD-) ST JUDE CHILDREN'S RES HOSPITAL.

XX
Bram RJ, Von Bulow G;
XX
WP1; 1998-506346/43.

RP5DB; AAV57328.

XX
New isolated transmembrane activator protein - used to develop products for treating e.g. infections, cancers, autoimmune and inflammatory conditions, transplant rejection or graft-versus-host disease.

XX
This is the amino acid sequence of novel human transmembrane activator cc and CAML-interactor (TAGI) protein, a lymphocyte protein that is involved in the calcium activation pathway. TAGI is normally present in B conditions, transplant respected to specifically regulate B cell responses involved in the calcium activation pathway. TAGI is normally present in B conditions and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. TAGI cDNA (seeV7328) was isolated condition are all activity. TAGI cDNA (seeV7328) was isolated conditions of TAGI recombinant DNA constructs, unicellular hosts, and contabled to TAGI protein. Methods are claimed for identifying nimunosuppressive drugs that selectively conditions or cancers. It can be blocked to provide contabled to increase immune system activity, e.g. for treating infections or cancers. It can be blocked to provide conditions such as immune complex-induced vascultis, glomerulonephritis, haemolytic anaemia, myasthenia gravis, type II collised are claimed are the ceptor or graft versus host disease trensplant rejection, rheumatoria darbinicial systemic lupus crythematosus, transplant rejection, rheumatoria gravis induced vasculties.

The present sequence represents a BCMA (not defined) polypeptide. BCMA is a necrosis factor (NF)-kB activator. The method of the invention is used to indentify compounds which modulate BCMA activity (and thus NF-kB activity). The specification describes a method of identifying a learning a library of with a cell which expresses a recombinant anti-cell death gene expression from a promoter. The method the promoter, and then determining whether the expression of the reporter gene is altered as a result of contact with library. The method is useful for identifying polypeptides which increase or decrease gene expression from a promoter. The BCMA polypeptide or nucleic acid are useful for preparing a pharmaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatoid arthritis, inflammatory bowel disease or septic shock. BCMA is useful for identifying compounds that modulate NF-kB expression and thus for drug

Human; BR43x2; TACI receptor; extracellular domain; BCWA; B cell protein; transmembrane activator and CAMI-interactor; tumour necrosis factor; TNF; ztnf4 activity; antibody production; autoimmune disease; amyloidosis; systemic lupus erythematosus; myasthenia gravis; multiple sclerosis; rheumatoid arthritis; asthma; bronchitis; emphysema; pyelonephritis; reand neoplasm; multiple mylomophritis; vasculitis; nephritis; renal neoplasm; multiple myloma; lymphoma; light chain neuropathy; immune response; immunosuppression; graft rejection; joint pain; graft versus host disease; inflammation; swelling; anaemia; septic shock; insulin dependent diabetes mellitus; Crohn's disease; hypertension; renal artery stenosis; occlusion; cholesterol; renal emboli.
 The present sequence represents a human BCMA protein, a B cell protein related to transmembrane activator and CAML-interactor (TACI) receptor. TACI is a tumour necrosis factor (TMR) receptor. The extracellular domains of BASA22 (an isoform of TACI) TACI or BCMA (a related B cell protein) receptor contain a cysteine rich domain, and are used for inhibiting ztnf4 activity. Ztnf4 is a TMF ligand. They may also be used for inhibiting BR43x2, TACI or BCMA receptor-ligand engagement associated with activated or resting B lymphocytes, effector T-cells, or with antibody production. The antibody production is associated with an autoimmune disease selected from systemic lupus erythemacrosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The ztnf4 activity and BR43x2, TACI or BCMA receptor-ligand engagement is associated with asthma, bronchitis, emphysema, end stage renal failure,

The present invention relates to Tumour necrosis factor (TNF) and Apol-
related Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules,
proteins (including homologues), and their antibodies. The invention in
particular relates to methods for regulating the interaction between TALL
and TALL-1 receptors (BCMA referred as B cell maturation factor) to
regulate monocyte, macrophage and B lymphocyte mediated immune responses.
TALL-1 protein is useful for identifying compounds that regulate B
lymphocyte proliferation. It is also useful for treating B lymphocyte
associated autoimmune disorders like rheumatoid arthritis, systemic lupus
crythematosus (SLB), insulin dependent diabetes mellitus, multiple
selerosis, myasthenia gravis, Grave's disease, autoimmune haemolytic
anaemia, autoimmune thrombocyte/copenia purpura, Goodpasture's syndrome,
pemphigus vulgaris, acute rheumatic fever, post-streptococcal
corresponding nucleic acid sequence are also useful in diagnostic assays.
The present sequence is a human B cell maturation factor (BCMA) protein.
It is the receptor for TALL-1 protein. BCMA gene is located on chromosome
consented the service of the synchroses of the prain, muscle, heart, lung, kidney, pancreas, testis and placenta.
BCMA mRNA is absent in the pro-B lymphocyte stage but its expression
increases with B lymphocyte maturation

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R. specific antibodies can be used for inhibiting B-cell growth, dendritic, cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoimmune disorders. B-cell lymphoproliferative disorders, hypertension and renal disorders. B-cell lymphoproliferative coll spreament of autoimmune disorders. B-cell lymphoproliferative disorders in the treatment of immunosuppressive disorders and HIV collection, and in patients undergoing organ transplantation. The BAFF-R proteins or BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R collipsions or altering an immune response involving a signalling pathway between BAFF-R and BAFF, thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythematosus, autoimmune haemolytic anaemia, grave's disease, multiple myseloma, B-cell cacids encoding there are specific and lymphomas. Invision of acids encoding there are proper and an analyzing and lymphomas. Invision of the contraction 180

The invention relates to a method of treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma. The method involves administering a composition comprising A proliferation inducing Ligana Receptor (APRIL-R) also referred as B cell maturation protein (BCM or BCMA) antagonist that antagonises the interaction between APRIL and its cognate receptor(9). This method is useful for treating undesired cell proliferation such as cancer or carcinoma e.g. human lung carcinoma, colon carcinoma, breast carcinoma, prostate carcinoma, breast carcinoma, breast carcinoma, prostate carcinoma, breast carcinoma, by APRIL. It is also useful for treating autoimmune diseases (Grave's disease, systemic lupus erythematosus-SIB); hypertension, cardiovascular diseases, ernal disorders, B-cell lympho-proliferation, inflammation and human immunodeficiency virus (HIV), and for treating, suppressing or altering immunodeficiency virus (HIV), and for treating, suppressing or altering con immune response involving a signalling pathway between APRIL-R and its also useful in gene therapy. The present sequence is human APRIL-R also referred as BCMA or BCM protein
 Treating a mammal for a condition associated with undesired cell proliferation such as cancer or carcinoma, comprises administering a composition comprising A Proliferation Inducing Ligand Receptor (APRIL-R) antagonist.

The present sequence is the protein sequence of a human polypeptide encoded by a gene that exhibits decreased expression in colon cancerderived metastases compared to normal colon tissue. It is an example of claimed polypeptides that are encoded by genes which are differentially expressed in metastatic colorectal cancer cells. Such polypeptides are useful in diagnostic and prognostic assays, for raising antibodies are e.g. in immunotherapy, and in screening for modulator compounds of

 The invention relates to the manufacture of a composition for inhibiting the proliferation of tumour cells. The method involves using an antibody component that binds both the B-cell maturation antigen (BCMA) and the transmembrane activator and calcium-modulator and cyclophilin ligandinteractor (TACI). BCMA and TACI binding antibody compositions are useful for inhibiting proliferation of tumour cells, particularly inhibiting ZTNF4 activity in a mammal associated with increased endogenous antibody
 production or a disorder consisting of neoplasm, chronic lymphocytic leukaemia, multiple myeloma, non-Hodgkin's lymphoma, post-transplantation lymphoproliferative disease or light chain gammopathy or inflammation e.g. asthma. The invention is also useful in gene therapy. The present is

 The invention relates to fusion proteins comprising transmembrane activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumnour necrosis factor-like protein (ZTNF)2 or ZTNF4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammation, graft rejection, anaemia and septic shock. The fusion proteins are also used in gene therapy. The present sequence is human B-cell maturation receptor (BCMA) protein used in the invention

The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2, by at least one modification in the region connecting &bgr; strands NO:2, by at least one modification in the region connecting &bgr; strands D and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antirheumatic, antiinflammatcry, antiathritic, neptrobic; and vasotropic activity. A TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 conformation a vaccine. A protein of the invention is useful for inhibiting TALL-1 conformation a vaccine a vaccine archititis, systemic lupus erythematosus, insulin dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, carave's disease, autoimmune themolytic anaemia, autoimmune thrombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, autote rheumatic fever, post-streptococcal glomerulonephritis and cutte rheumatic fever, post-streptococcal glomerulonephritis and polyarteritis nodosa. The present sequence represents human BCMA.

 The present sequence represents a human BCMA polypeptide. The specification also describes TACI and BR3 polypeptides. TACI and BR3 are receptors. Tumour necrosis factor (TNF) family ligands TALL-1 and April bind to the TACI receptor, while TNF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for preparing a composition for treating systemic lupus erythematosus

The present invention describes an isolated polynuclectide (I), which is overexpressed in haematological malignancies, and which encodes a coverexpressed in haematological malignancies, and which encodes a colypeptide or an immunogenic fragment of the polypeptide. (2) an expression vector comprising (I) operably linked to an expression control sequence; (3) a constraint of the polypeptide or its immunogenic fragment; and specifically binds to the polypeptide or its immunogenic fragment; encoded by (i). (i) has cytostatic and immunostimulant activities, and can be used in vaccines and immunostherapy. The immunoconjugates are useful in composition for treating cancer, e.g. multiple myeloma call, chronic lymphocytic leukaemia, B cell leukaemia, and imultiple myeloma in humans, sheep, primates, goats, bovines, equines, porcines, lupines, cancer agents, and generating antibodies or immunoconjugates for treating cancer. Cancer agents, and generating antibodies or immunoconjugates for treating cancer agents, and generating antibodies or immunoconjugates for treating cancer agents, and generating antibodies or immunoconjugates for treating corporation or mathodogy can be used for detecting, diagnosing or propropried or antibody can be used for detecting, diagnosing or present sequence is used in the exemplification of the present invention.

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BCMA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TNF (tumour necrosis factor) [anally, acting as an immunoregulatory capent, and also plays a role in the development of hypertension and capent, and also plays a role in the development of hypertension and percent of secondaring it, and BAFF-R. specific antibodies can be used for inhibiting B-cell growth, dendritic call-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autonomy and immunoglobulin production, and in the treatment of immunosuppressive disorders and HIV closed in the treatment of immunosuppressive disorders and HIV closed in the treatment of immunosuppressive disorders and HIV corteins or BAFF-R specific antibodies may be used for treating, between BAFF-R and BAFF-R thereby inhibiting inflammation. Since BAFF-R inhibits B-cell growth and maturation it is useful for treating diseases such as systemic lupus erythmatosus, autoimmune haemolytic anaemia, grave's disease, multiple myeloma, B-cell carcinomas, lumphomas, lumphomas, lumphomas, lumphomas, lumphomas, lumphomas, lumphommune disorders and inherited B-cell associated disorders and inherited B-cell associated disorders. The bare in the language of the BAFF in the signification in the significance of the ģ PJST535. However, this BAFF-R protein sequence is 27 amino acids than that given in AAB60698 present sequence represents a human BAFF-R protein sequence as encoded plasmid DJST535. However, this BAFF-R protein sequence is 27 amino acid

death Identifying a modulator of gene expression for drug designing, by contacting a compound library with a cell expressing an anti-cell degene and reporter gene, and determining alteration in reporter gene expression

Claim 32; Fig 7B; 53pp; English.

a necrosis factor (NP)-kB activator. The method of the invention is used activity, compounds which modulate BCMA activity (and thus NP-kB activity). The specification describes a method of identifying a polypeptide which increases gene expression from a promoter. The method involves contacting a library of with a cell which expresses the ecombinant anti-cell death gene and a reporter gene operably linked to the promoter, and then determining whether the expression of the reporter gene is altered as a result of contact with library. The method is useful for identifying polypeptides which increase or decrease gene expression from a promoter. The BCMA polypeptide or nucleic acid are useful for preparing a pharmaceutical composition for treating cancer, apoptosis, viral infections, inflammatory response, such as rheumatoid arthritis, inflammatory bowel disease or septic shock. BCMA is useful for identifying compounds that modulate NF-kB expression and thus for drug The present sequence represents a BCMA (not defined) designing

The present invention relates to Tumour necrosis factor (TNF) and Apolrelated Leucocyte expressed Ligand 1 (TALL-1) nucleic acid molecules, proteins (including homologues), and their antibodies. The invention in particular relates to methods for requlating the interaction between TALL-1 and TALL-1 receptors (BCMA referred as B cell maturation factor) to regulate monocyte, macrophage and B lymphocyte mediated immune responses. TALL-1 protein is useful for identifying compounds that regulate B lymphocyte proliferation. It is also useful for treating B lymphocyte associated autoimmune disorders like rhemmatoid arthritis, systemic lupus erythematosus (SLE), insulin dependent diabetes mellitus, multiple sclerosis, myasthenia gravis, Grave's disease, autoimmune haemolytic

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRIL (G70, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, capatrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antegonists are useful for treating inflammacion and immune function diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic carmatitis, respiratory allergic disease (asthma, hypersensitivity) lung disease), drug and insect sting allergy, inflammatory bowel disease (crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumaciod arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence is human BCMA cysteine-rich extracellular region

The invention relates to the use of a BAFF receptor (BAFF-R, also known as BORA) protein, or a BAFF-R fusion protein as an agent for the treatment of a variety of immune-related disorders. BAFF-R is a member of the TMF (tumour necrosis factor) family, acting as an immunoregulatory agent, and also plays a role in the development of hypertension and related disorders. BAFF-R, fusion proteins containing it, and BAFF-R. specific antibodies can be used for inhibiting B-cell growth, dendritic cell-induced B-cell growth and maturation, and immunoglobulin production, and in the treatment of autoinmune disorders. The BAFF-R proteins may also be used in the treatment of immunosuppressive disorders and HIV infection, and in patients undergoing organ transplantation. The BAFF-R proteins or BAFF-R specific antibodies may be used for treating, suppressing or altering an immune response involving a signalling pathway suppressing or altering an immune response involving a signalling pathway inhibits B-cell growth and maturation if is useful for treating diseases inthibits B-cell growth and maturation in law in systemic lupus erythematosus, autoimmune haemolytic aniaemia.
 Inhibiting dendritic cell-induced B-cell growth, maturation and B-cell lympho-proliferative disorder by administering BAFF-receptor polypeptide, chimeric molecule comprising receptor or anti-BAFF-R antibody homolog.
 Grave's disease, multiple myeloma, B-cell carcinomas, leukaemia, rapidly progressive glomerulonephritis, and lymphomas. Nucleic acids encoding human BAFF-R may be used in gene therapy to treat tumours, lymphomas, autoimmune disorders and inherited B-cell-associated disorders. The

The inversion traces to a mention of clearing as manimal total as condition.

The method involves administering a composition comprising A Proliferation inducing Ligand Receptor (APRIL-) also referred as B cell maturation protein (BCM or BCMA) antagonist that antagonises the maturation protein (BCM or BCMA) antagonist that antagonises the interaction between APRIL and its cognate receptor(s). This method is cusful for treating undesired cell proliferation such as cancer or carcinoma, and other carcinoma, colon carcinoma, breast carcinoma, prostate carcinoma, and other carcinomas whose proliferation is modulated by APRIL. It is also useful for treating autolimmune diseases (Grave's disease, renal disorders, B-cell lympho-proliferative disorders, and immunedaticiency virus (HIV), and for treating, suppressing or altering immunodeficiency virus (HIV), and for treating, suppressing or altering a fusion construct containing human APRIL-R also referred as BCMA or BCM protein, For region of human immunoglobulin (1gG) and a signal a signal construct containing human APRIL-R also referred as BCMA or BCM protein, For region of human immunoglobulin (1gG) and a signal

Claim 1; Fig 10A; 94pp; English.

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering a specific binding partner for APRLI (GTO, a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in amammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, psoriasis, alergies, puncumonia, atopic diseases und as diarrhoea, psoriasis, alergies, puncumonia, atopic disease, drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autoimmune disease (multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer sequence or such an experience or sequence or solver sequence or such and sease to sequence or such and is human BCMA protein cysteine-rich consensus region

The invention relates to a novel TALL-1 antagonist protein, comprising a sequence that differs from SEQ ID NO:2, or amino acids 134-285 of SEQ ID NO:2, by at least one modification in the region connecting &bgr; strands D and E that reduces the biological activity of the TALL-1 antagonist as compared to wild-type TALL-1. A protein of the invention has immunosuppressive, antirheumatic, antinflammatory, antiarthritic, nephrotropic, and vasotropic activity, a TALL-1 antagonist may be used in a vaccine. A protein of the invention is useful for inhibiting TALL-1 biological activity in a mammal. To is useful for inhibiting TALL-1 biological activity in a mammal. To is useful for inhibiting TALL-1 biological activity in a mammal. To is useful for inhibiting TALL-1 biological activity in a mammal. To is useful for inhibiting TALL-1 cases as theumatoid architis, sultiple sclerosis, myasthaenia gravis, dependent diabetes mellitus, multiple sclerosis, myasthaenia gravis, thrombocytopenic purpura, Goodpasture's syndrome, pemphigus vulgaris, cutte rheumatic fever, post-streptococcal glomerulonephritis and polyareritis and present sequence represents a cysteine rich
 Novel TALL-1 antagonist protein useful for inhibiting TALL-1 biological activity in mammal, has a modification in the region connecting beta strands D and E that reduces the biological activity of TALL-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a neutrokine-alpha protein in crystalline form. The crystalline neutrokine-alpha protein is useful for designing molecules that have biological activity or compounds that bind, inhibit or minic a neutrokine-alpha protein and/or enhance the activity of a neutrokine-alpha protein. The three-dimensional structure of a neutrokine-alpha protein in determining the three-dimensional of other neutrokine-alpha proteins and their homologs. The compounds that mimic, prevent or inhibit the activity of the protein are useful for treating
and vasculitis. Disorders may be treated with the novel composition using gene therapy. This sequence represents a TALL-1 related protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      crystalline Neutrokine-alpha protein, useful for designing compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer, allergic disorders, or autoimmune diseases such as rheumatoid arthritis, multiple sclerosis, Crohn's disease, diabetes, systemic lupus erythematosus or asthma. This sequence represents the residues in the receptor for binding a cytokine ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein co-ordinate data, cytostatic, antiallergic; immunosuppressive; antirheumatic; antiatthritic; neuroprotective; antinflammatory; antidiabetic; dermatological; antiasthmatic; neutrokine-alpha; crystallography; cancer; allergic disorder; autoimmune disease; rheumatoid arthritis; multiple sclerosis; Crohn's disease; diabetes; systemic lupus erythematosus; asthma; receptor.

```
TRAF3-binding B cell-specific receptor and encoded gene, applicable in diagnosis of abnormality due to TRAF3-mediated intracellular signal transduction and in screening drugs for e.g. cancer, autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse; TRAF3-binding B cell-specific receptor; TRAF3; signal transduction; TNF ligand; cancer; autoimmune disease; apoplexia; viral infection; AIDS; bone disease; transplantation rejection; Alzheimer's disease; ischaemia; rheumatoid arthritis; cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a murine TRAF3-binding B cell-specific receptor. The polynucleotide and polypeptide sequence of this receptor are useful for diagnosis of abnormality due to TRAF3-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      intracellular signal transduction and in screening drugs for diseases associated with TNF ligand family and TNF receptor-ligand superfamily e.g. cancer, autoimmune diseases, viral infections like AIDS, bone diseases, transplantation rejection, Alzheimer's disease, ischaemia, rheumatoid arthritis, apoplexia and cachexia
                                                                                                                                                                                                                                                                                                                                                                                                           Amino acid sequence of murine TRAF3-binding B cell-specific receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 5; Length 175;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12.1%; Score 116.5; DB 5

```

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Fractor (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune cancel sisease, anti-phospholipid syndrome, Wegener's granulomatosis, colls disorders e.g., multiple myelome, Wegener's granulomatosis, and canon-tracitis nodosa and rapidly progressive glomerulonephritis. Plasma cells disorders e.g., multiple myelome, Weldenstrom's, macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and concein, protein homologues, and antibodies may further be used in screening assays, in detection assays (chromosomal mapping, tissue typing or of forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful as immunogens tor pharmacogenomic) are further useful as immunogens to raise anti-BFFR activity or expression.

activities, and can be used in gene therapy. (I) can be used for inhibiting, in a mammal, the activity of a ligand that binds Zuffr12 (e.g. ZTWF4), for treating disorders and diseases associated with B (ymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour cells. (I) is useful for treating autoimnume disorders such as systemic lupus erythematosus, mysathenia gravis, multiple sclerosis, insulin dependent diabetes mellitus, asthma, rheumatoid arthritis, bronchitis, emphysema and end stage renal failure or renal diseases such as sponenties, and for treating renal correspond any pyelonephyritis, vasculatis, chronic lymphoid leukaemia, nephritis, and pyelonephyritis, and for treating renal complasms, multiple myelones, lymphomas, light chain neuropathy, or modulating the immune system, for regulating B cell responses and development, for modulating development of other cells, antibody production and crown's disease. (I) is useful for modulating the immune system, for regulating B cell responses and development, for modulating development of other cells, antibody production and cytokine production, and for modulating T and B cell communication. The present sequence represents mouse Ztnfr12 which is given in the exemplification of the present invention

           The present sequence represents a murine BR3 polypeptide. The specification also describes TACI polypeptides. TACI and BR3 are receptors. Tunnumers and BR3 are bind to the TACI receptor, while TNF family ligands TALL-1 and April bind to the TACI receptor, while TNF family ligands TALL-1 also binds to BR3 receptor. The TACI and BR3 receptor nucleic acid is useful for

unmourspanic conditions or inherited genetic disorders involving breaths, the unmourspanic conditions or inherited genetic disorders, inflammation, organ transplantation and HIV. Autoimmune disorders, inflammation, organ transplantation and HIV. Autoimmune to diseases, which can be treated or prevented by BAFF.K. include systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune haemolytic anaemia, idiopathic thrombocytopaenia purpura, Chagas' disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulonephritis. Plasma cells disorders e.g., multiple myeloma, Waldenstrom's macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and monoclonal gammapathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in screening assays, in detection assays (chromosomal mapping, tissue typing or forenisc biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful as immunogens to raise anti-BFFR antibodies, or in creening drugs or compounds that modulate BAFFR antibodies, or in the present sequence is human BAFFR protein mutant. Note: The present sequence is human BAFFR protein mutant. Note: The present sequence is human BAFFR protein mutant. Note: The present sequence is human BAFFR protein mutant is derived from human BAFFR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, BAFF receptor; BAFF-R; cytostatic; hypotensive; inflammation; TNF; Tumour Necrosis Factor; autoimmune disease; immunosuppressive; cancer; myasthenia gravis; hypertension; organ transplantation; drug screening; HIV; human immunodeficiency virus; genetic disorder; cardiovascular;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                107 SRIGDEIILPRGLEYTVEECTC-----EDCIKSKPKVDSDHCFPLPAMEEGATILVIT 159

                                                                                                                                                                                                          The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Mecrosis Pector (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic diseases involving B-cells, tumourigenic conditions or inherited genetic diseases.
                                          proteins and nucleic acids, useful for treating
                                                             preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular disorders, or renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CSQNEYFDSLLHACIPCQL------RCSSNTPPLTC---QRYCNASVTNSVKGTNAI

New human BAFF receptor proteins and nucleic acids, useful for treating, preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular disorders, or renal disorders.

Example 17; Page; 164pp; English.

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Factor (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune Captoress, which can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, mysathenia gravis, autoimmune captoressive disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodose and rapidly progressive glomerulonephritis. Plasma cells disorders e.g., multiple myeloma, Weldenstrom's macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and connoclonal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in streening assays, in detection assays (chromosomal mapping, tissue typing or forensic bloology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful a immunogens to raise anti-BFFR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression. The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant in fig 2d of the specification

Inhibiting activity of B cell maturation protein and/or transmembrane activator and intracellular cyclophilin ligand interactor, by administering a binding partner for APRIL, a tumor necrosis factor family ligand

Disclosure; Fig 10A; 94pp; English.

The invention relates to a method for inhibiting TACI (transmembrane activator and intracellular CAML interactor) and/or B cell maturation protein (BCMA) activity in a mammal. The method comprises administering specific binding partner for APRIL (GTO), a tumour necrosis factor-TNF family ligand), having the consensus region of TACI, BCMA, or the TACI/BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI and/or BCMA in a mammal which is useful for treating B-cell or T-cell lymphoproliferative disorders, one or more solid tumours such as lung, gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI antagonists are useful for treating inflammation and immune function diseases such as diarrhoea, postiasis, allergies, pneumonia, atopic dermatitis, respiratory allergic disease (asthma, hypersensitivity lung

tumourigenic conditions or inherited genetic disorders involving B-cells, the present of disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune disorders, inflammation, organ transplantation and HIV. Autoimmune chaemolytic anaemia, idopathic prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, mysathenia gravis, autoimmune haemolytic anaemia, idopathic thrombocytopaemia purpura, chagas disease Grave's disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulonephritis. Plasma cells disorders e.g., multiple myeloma, Waldenstrom's macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and chartering anopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in sortein, protein homologues, and antibodies may further be used in corening assays, in detection assays (chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or paramacogenemic). The polypeptides are further useful as immunogens to raise anti-BFRR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression. The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant. Note: The present sequence is human BAFF-R protein mutant. Note the present experience is not shown in the specification but is derived from human BAFF-R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         159

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Factor (TMF) family, which is associated with the expression of Decells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythematoaus, rheumatoid arthritis, myasthenia gravis, autoimmune can be among the disorders of an include arthritis, myasthenia gravis, autoimmune can disease, anti-phospholiph dyndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulonephritis. Plasma calls disorders e.g., multiple myeloma, Waldenstrom & macolophulinamaia, monoclonal gammopathy of undetermined significance. The nucleic acids, protean, protein, protein, protein, and antibodies may further be used in carrenting assays in dartering assays (and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies may further be used in a contain and antibodies and antib
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 screening assays, in detection assays (chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or parametery. The polypeptides are further useful as immunogens to raise anti-BFFR antibodies, or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening drugs or compounds that modulate BAFF-R activity or expression. The present sequence is human BAFF-R protein mutant. Note: The present sequence is not shown in the specification but is derived from human BAFF-R referred as SEQ ID NO: 5 (AAE22242) and shown in fig 2d of the
                                                                                                                                                                                                                                                                                                                        New human BAFF receptor proteins and nucleic acids, useful for treating, preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular disorders, or renal

The present invention relates to a tumor necrosis factor and apoptosis ligand-related leukocyte-expressed ligand 1 receptor (ThLL-1R) bolypeptide of the invention is useful for treating, preventing, or ameliorating a medical disease, condition or disorder, preferably a TALL-1R polypeptide-related disease, where the disease condition or disorder is rheumatoid arthritis, systemic lupus condition or disorder is rheumatoid arthritis, systemic lupus inflammation or immune function. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject. The present sequence represents a TALL-1R gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ---SWRRRQQRLRGAASTE-- 116

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Factor (FMF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal disorders, inflammation, organ transplantation and HIV. Autoimmune of disorders, inflammation, organ transplantation and HIV. Autoimmune cancer, thematogus, rheumatoid arthritis, myasthenia gravis, autoimmune cancer, diseases, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulomatosis, calls disorders e.g., multiple myeloma, Maldenstrom's macroglobulinaemia, monoclomal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in the control of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; BAFF receptor; BAFF-R; cytostatic; hypotensive; inflammation; TNF; Tumour Necrosis Factor; autoimmune disease; immunosuppressive; cancer; myaethenia gravis; hypertension; organ transplantation; drug screening; HIV; human immunodeficiency virus; genetic disorder; cardiovascular; renal; rheumatoid arthritis; systemic lupus erythematosus; amyloidosis; haemolytic anaemia; Chagas' disease; Grave's disease; glomerulonephritis; multiple myeloma; chromosomal mapping; tissue typing; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bereening assays, in defection assays (chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Decrosis Factor (TNF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins, DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumourigenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders, immunosuppressive diseases, renal diseases, which can be treated or prevented by BAFF-R, include systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune hamolytic anaemia, idiopathic thrombocytopaenia purpura, Chagas' disease Grave's disease, anti-phospholipid syndrome, Wegener's granulomatosis, poly-arteritis nodosa and rapidly progressive glomerulonatosis, calls disorders e.g., multiple myeloma, Waldenstrom's macroglobulinaemia, monoclomal gammopathy of undetermined significance. The nucleic acids, protein, protein homologues, and antibodies may further be used in processive delay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               screening assays, in detection assays (chromosomal mapping, tissue typing or foremaic biology), predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, or pharmacogenomic). The polypeptides are further useful as immunogens to raise anti-BFR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is human BAPP-R protein mutant, Note: The present sequence is not shown in the specification but is derived from human BAPP-R referred as SEQ ID NO: 5 (AAE22242) and shown in fig 2d of the
preventing or delaying e.g. autoimmune diseases, cancers, inherited
genetic disorders involving B-cells, cardiovascular disorders, or renal

The invention relates to human BAFF receptor (BAFF-R) nucleic acids and proteins. BAFF-R is a B-cell activating factor belonging to the Tumour Necrosis Factor TANF) family, which is associated with the expression of B-cells and immunoglobulins. The BAFF-R proteins. DNA and antibodies are useful for treating, preventing or delaying autoimmune diseases, cancer, tumouriqenic conditions or inherited genetic disorders involving B-cells, hypertension, cardiovascular disorders immunosuppressive diseases, renal diseases, which can be treated or prevented by BAFF-R, include systemic clupus erythematosus. Thematoid arthritis, mysathenia gravis, autoimmune haemolytic anaemia, idiopathic thrombocytopaenia purpura, Chagas' disease Grave's disease, anti-phospholipid syndrome, Negener's granulomatosis, colls disorders e.g., multiple myeloma, Waldenstrom's, macroglobulinaemia, heavy-chain disease, primary or immunocyte-associated amyloidosis, and monoclonal gammopathy of undetermined significance. The nucleic acids, cortion protein homologues, and antibodies and ristals, and monoclonal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic or prognostic are further useful as immunogene traits anti-BFFR antibodies, or in screening drugs or compounds that modulate BAFF-R activity or expression.

The present sequence is human mature JST576 (BAFF-R) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ₩
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New human BAFF receptor proteins and nucleic acids, useful for treating, preventing or delaying e.g. autoimmune diseases, cancers, inherited genetic disorders involving B-cells, cardiovascular disorders, or renal

(1) has cytostatic, immunosuppressive, designated Ztnfr12 (1). (1) has cytostatic, immunosuppressive, antidiabetic, antidiabetic, neutrorective, antidiabetic, antidiabetic, antidiabetic, antidiathmatic, nephrotropic and hypotensive activities, and can be used in gene therapy. (1) can be used for inhibiting, in a mammal, the activity of a ligand that binds Ztnfr12 (e.g. ZTNF4), for treating disorders and diseases associated with B lymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour cells. (1) is useful for treating

activator and calcium modulator and cyclophilin ligand-interactor (TACI) receptor group that binds tumour necrosis factor-like protein (ZTMP) or ZTMF4; and an immunoglobulin group comprising a constant region of an immunoglobulin. The invention is used to manufacture a medicament for inhibiting the proliferation of tumour cells in a mammalian subject. The composition comprising the fusion protein may also be used in treating autoimmune diseases (e.g. systemic lupus erythematosus, multiple autoimmune diseases (e.g. systemic lupus erythematosus, multiple sclerosis, diabetes mellitus, rheumatoid arthritis and asthma), renal diseases (e.g. glomerulonephritis), bronchitis, inflammantion, graft rejection, anaemia and septic shock. The fusion proteins are also used in gene therapy. The present sequence is human Ztnfr12 receptor protein
interactor (TACI)-immunoglobulin fusion protein, for treating cancer or diabetes, comprises a TACI receptor group and an immunoglobulin group.
                                                                                                                                                         The invention relates to fusion proteins comprising transmembrane
                                                                                            Disclosure; Col 136-137; 71pp; English.
